# Hill End Gold reports 'robust' Red Hill result

Hill End Gold described their revised geological model for the Red Hill Deposit as "robust" in a release to the Australian Securities Exchange on Wednesday.

The Red Hill Deposit is located about five kilometres north of Hill End and has an inferred resource estimate of 849,300 tonnes of gold.

The release said final results of the Red Hill RC drilling program were recently received, following up the assay of interpreted mineralised sedimentary host rocks.

Drill holes targeted shallow mineralisation in the southern part of the deposit where previous drilling indicated potential for open pit mining.

Nine shallow RC holes were completed for a total of 590 metres over a strike length of 180 metres.

Hill End Gold managing director Philip Bruce said the infill assay of the RC program confirmed broad zone of low grade gold mineralisation.

"The Red Hill Deposit is only partially drilled over a strike length of more than one kilometre and further infill assaying and drilling is planned to target shallow open pit potential," he said.
